Basic Steps to Prediction

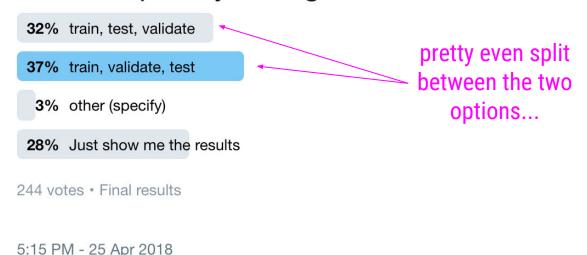

data splitting

What do you call the datasets you use for (1) training, (2) feature selection and hyperparameter tuning, and (3) quantifying performance. Please share your reasoning and disciplinary background too.

https://twitter.com/michaelhoffman/status/989251677646704641

Michael Hoffman @michaelhoffman · Apr 27

@CarldeBoerPhD suggests train, tune, test as an alternative. I think I like that. "Tune" is a better description for what goes on in the second part and it avoids the contentious and multisyllabic "validate".

Carl de Boer @CarldeBoerPhD

Let's all switch to train, tune, test Alliterative and descriptive.

Alliterscriptive.

we'll go with **train, tune, test** instead

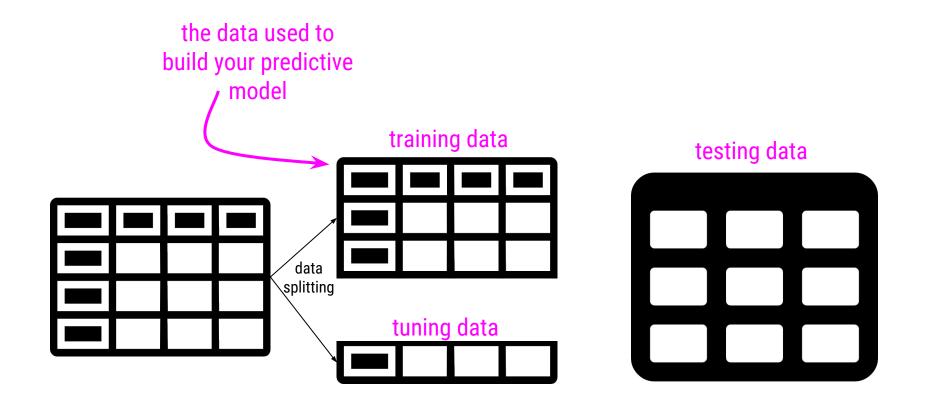

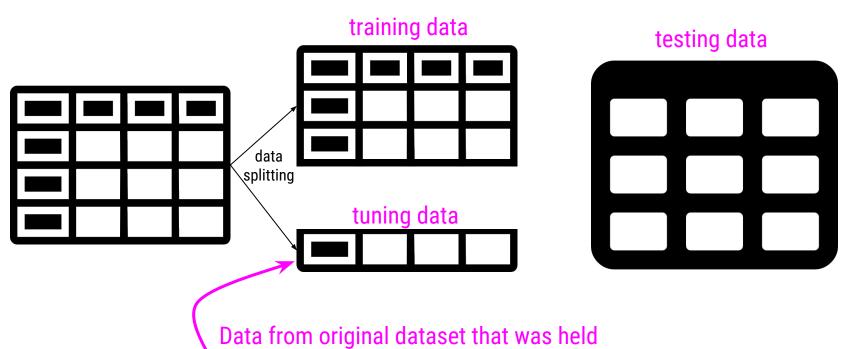

2

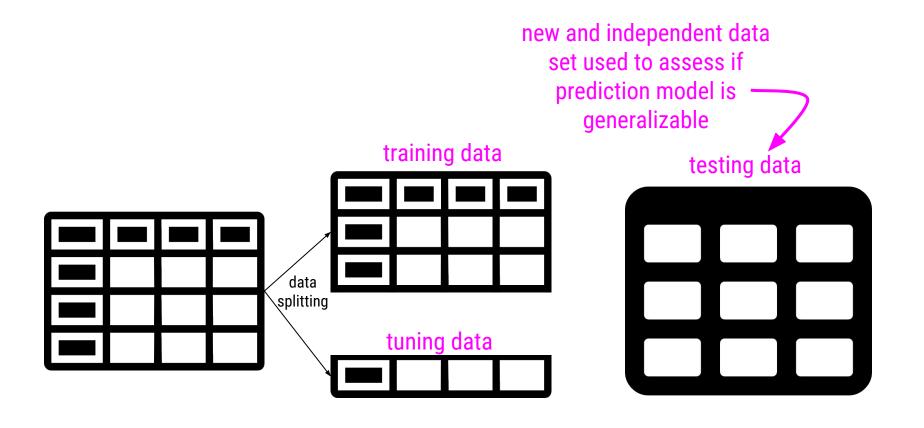

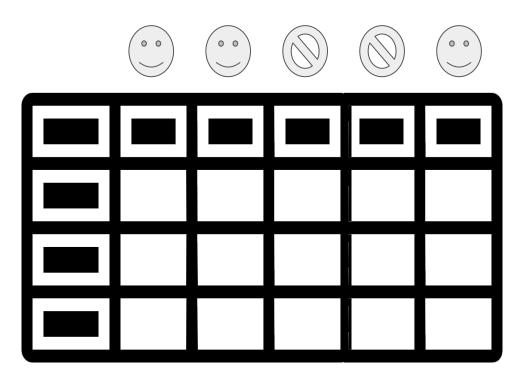

14

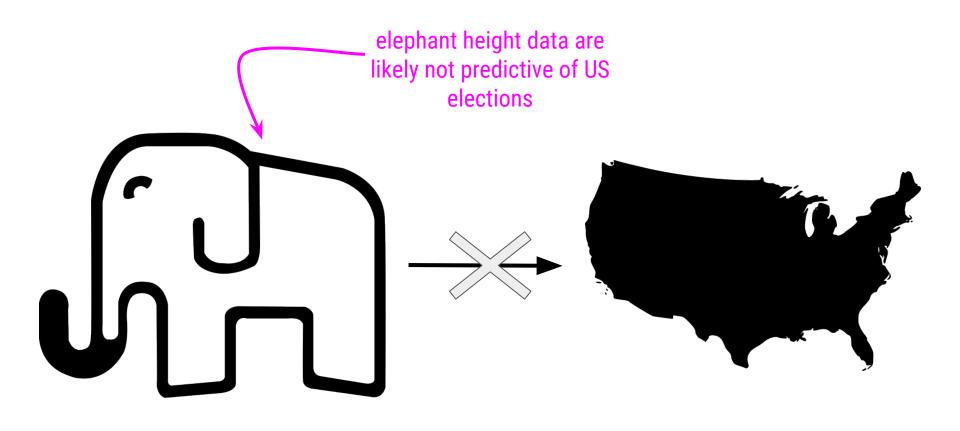

Data from original dataset that was held out and not used in training the model; helpful in fine-tuning prediction accuracy

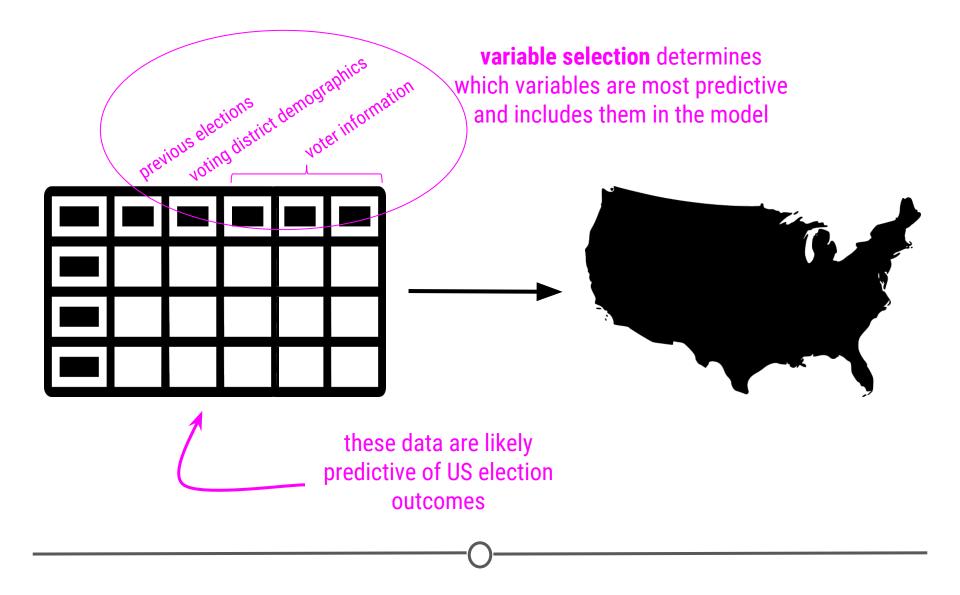

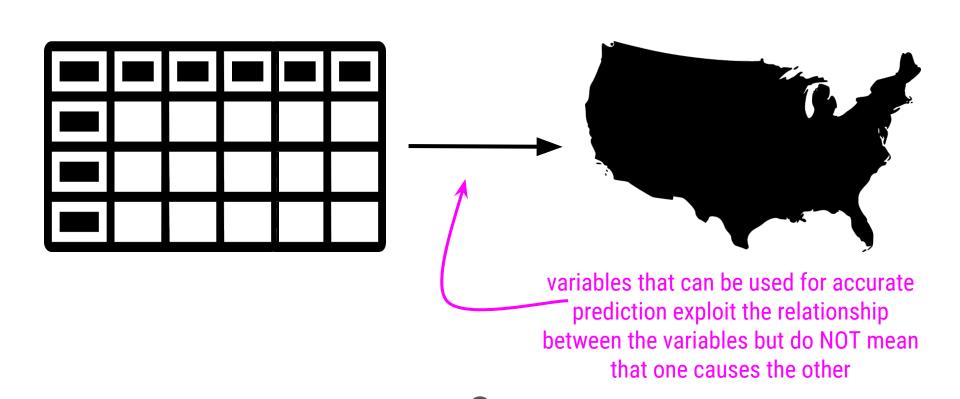

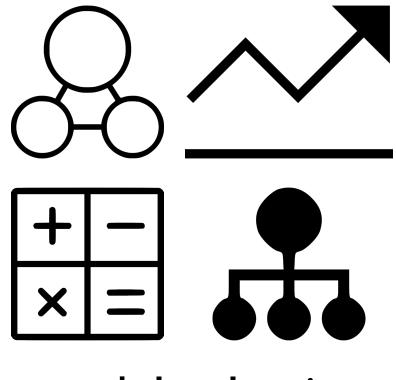

variable selection

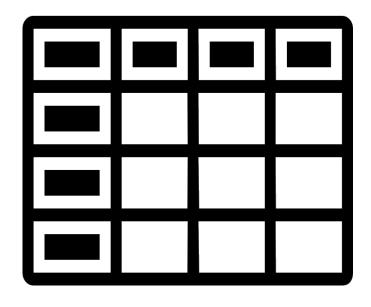

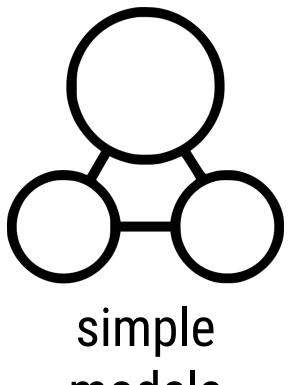

model selection

big datasets

models

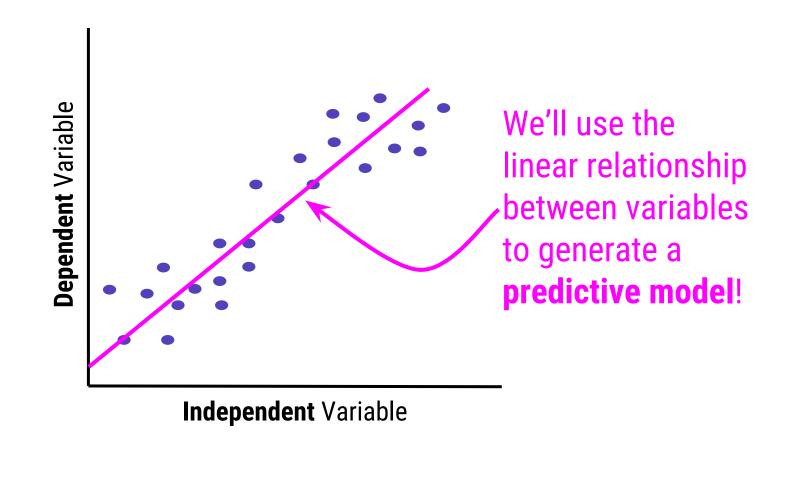

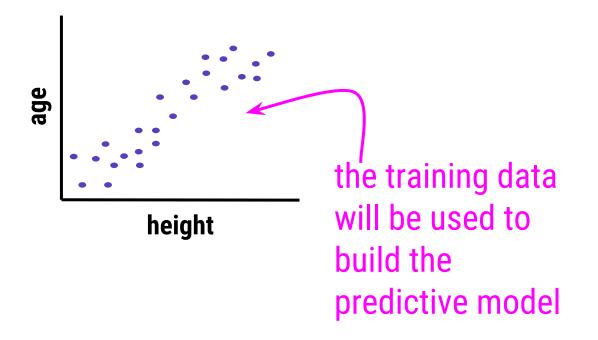

predicting continuous variables (i.e. Age)

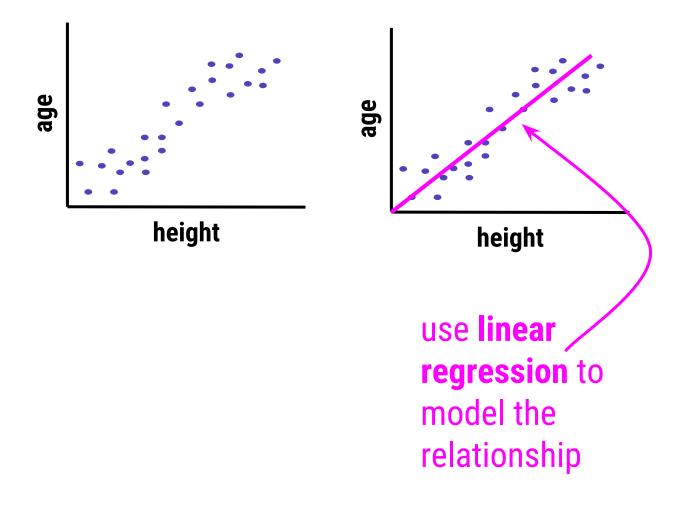

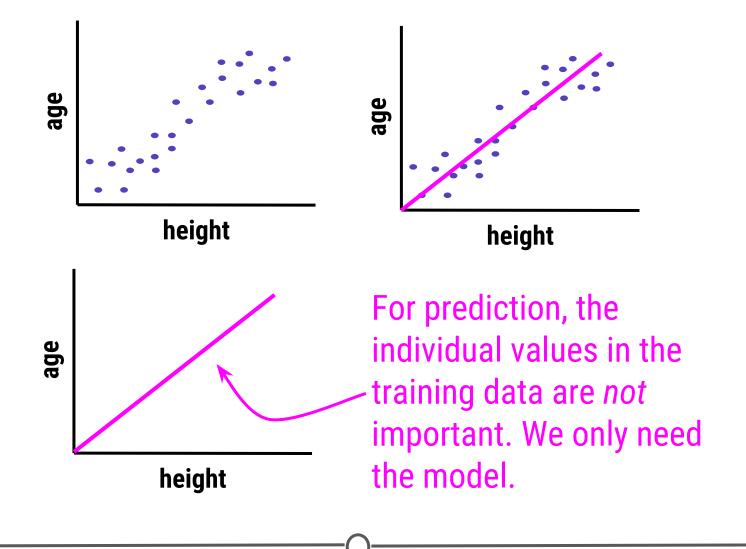

Classification:

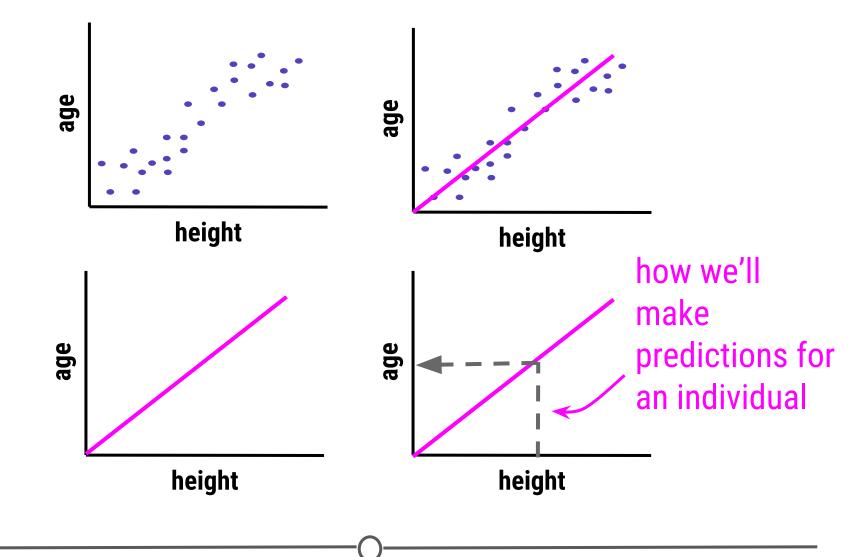

predicting categorical variables (i.e. education level)

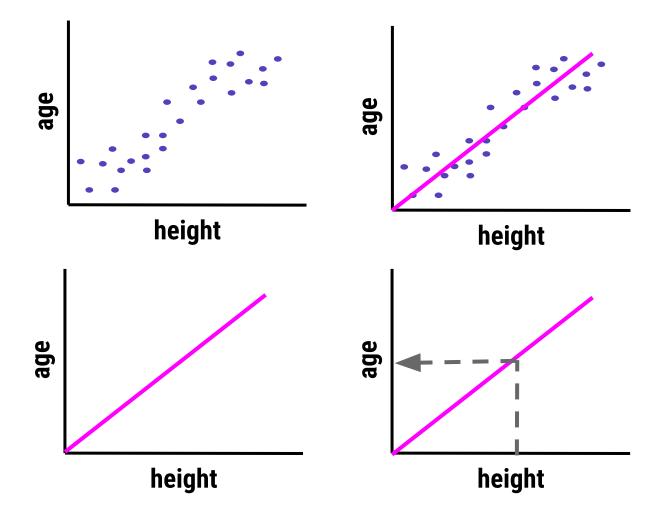

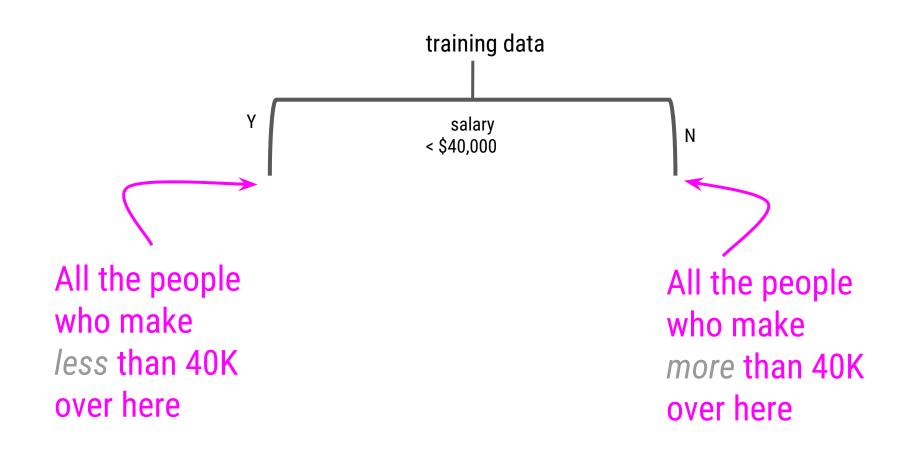

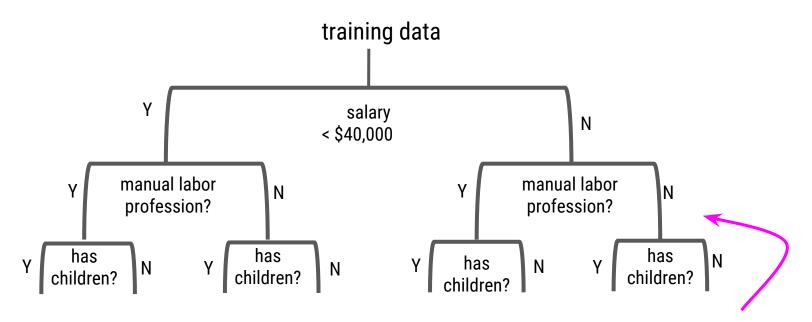

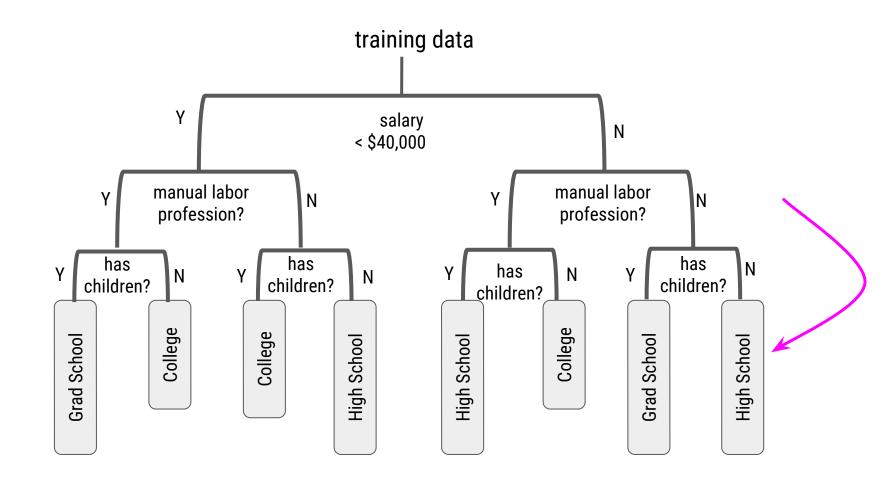

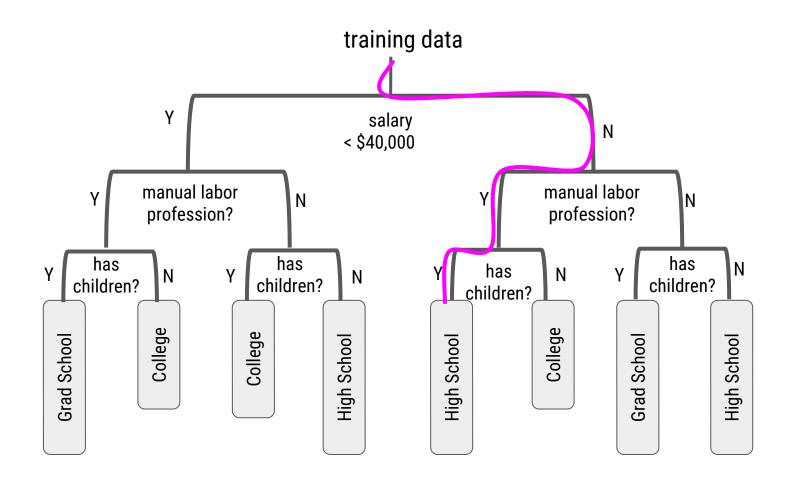

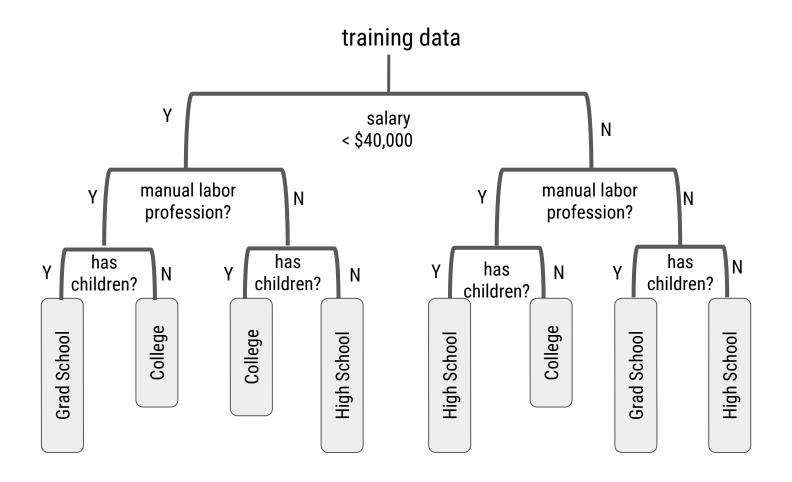

Continue building the decision tree where the variables and information in the training data decide who goes down which branch

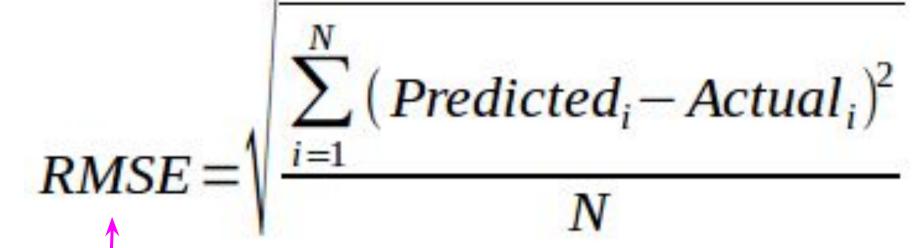

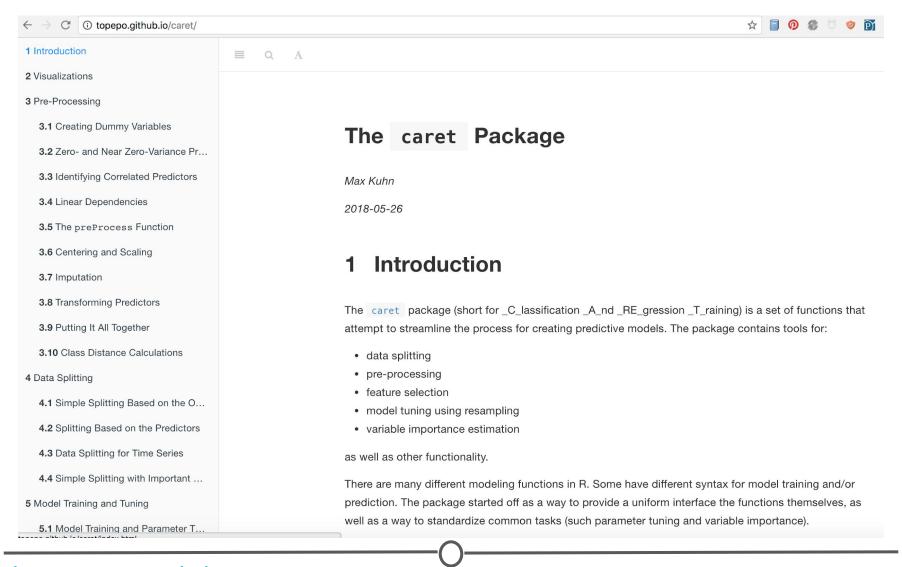

accuracy assessment

$RMSE = \sqrt{\frac{\sum_{i=1}^{N} (Predicted_{i} - Actual_{i})^{2}}{N}}$

A few outliers can lead to a big increase in RMSE, even if all the other predictions are pretty good

 $Accuracy = \frac{\text{# of samples predicted correctly}}{\text{# of samples predicted}} *$

iris {datasets}

Edgar Anderson's Iris Data

Description

This famous (Fisher's or Anderson's) iris data set gives the measurements in centimeters of the variables sepal length and width and petal length and width, respectively, for 50 flowers from each of 3 species of iris. The species are *Iris setosa*, *versicolor*, and *virginica*.

Usage

iris iris3

Format

iris is a data frame with 150 cases (rows) and 5 variables (columns) named Sepal.Length, Sepal.Width, Petal.Length, Petal.Width, and Species.

iris3 gives the same data arranged as a 3-dimensional array of size 50 by 4 by 3, as represented by S-PLUS. The first dimension gives the case number within the species subsample, the second the measurements with names Sepal L., Sepal W., Petal L., and Petal W., and the third the species.

Source

Fisher, R. A. (1936) The use of multiple measurements in taxonomic problems. Annals of Eugenics, 7, Part II, 179–188.

The data were collected by Anderson, Edgar (1935). The irises of the Gaspe Peninsula, Bulletin of the American Iris Society, 59, 2-5.
